

Betoms

(short version)

The message, all things around us formed by about 100 different types of atoms, is impressed.

The message, all this atom and additional the light and additional the electric and magnetic fields and finally the gravity field are formed by only one type of particle, the BETOMS, is at least interest.

The standard model of the physics of elementary particles need 12 types of particles and additional three types of forces.

Betoms general not need forces.

At the standard model of the physics of elementary particles the particles have more differently attribute:

Rest mass

Charge

Spin

Electromagnetic force

Low and strong core forces

Gravity force

Velocity

The betoms have only two attributes:

They moved with velocity of light (vacuum).

They reflect each other.

A particle, the BETOM, with only two attributes –simpler is scarcely.
